

# Is NanoShuttle<sup>™</sup> biocompatible? YES!

We get asked this question all the time, and the answer is always yes. NanoShuttle<sup>™</sup> is a nanoparticle assembly (~50 nm) consisting of gold, iron oxide, and poly-L-lysine (PLL)<sup>1</sup> that attaches to the plasma membrane electrostatically (50 pg/cell).

# NanoShuttle<sup>™</sup>:

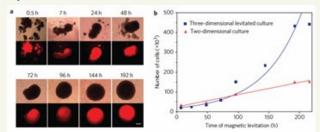

- Consists of biocompatible components: 6 iron oxide and PLL are recognized as safe by the FDA<sup>2,3</sup> and gold nanoparticles are in clinical trials for therapeutic use, with no indications for system toxicity<sup>4</sup>
- Does not bind any specific receptors, works 6 with all cell types
- Will release off the cell over 7-8 days into 6 the surrounding extracellular matrix, as shown by transmission electron microscopy (TEM)
- Requires magnetic forces (30 pN) only 6 strong enough to aggregate but not harm cells
- 6 Will not affect proliferation<sup>5,6</sup>, viability<sup>6</sup>, metabolism<sup>5,7</sup>, inflammatory<sup>5</sup> or oxidative stress<sup>8</sup>, phenotype<sup>5,7,8</sup>, and other macro cell functions
- does not cause any chromosomal abnor-6 malities in cells, as shown by comparative genomic hybridization (CGH)

# Overall, NanoShuttle<sup>™</sup> is biocompatible and facilitates rapid 3D culture formation.

Spheroid Growth

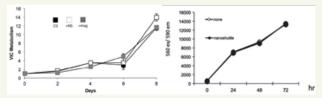

Over 8 d, mCherry-tagged gioblastoma grow faster in 3D vs. 2D1

## Transmission Electron Microscopy

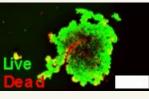

After 24 h (left), NanoShuttle<sup>™</sup> is localized with the cells, but by 8 d (right) move out of the cell and into the extracellular space1

## Proliferation, Metabolism

Neither NanoShuttle<sup>™</sup> nor magnetic forces have any effect on the proliferation of valvular interstitial cells (VIC, left)<sup>7</sup> and 3T3 fibroblasts<sup>6</sup> (right)

### Viability

NanoShuttle<sup>™</sup> has no effect on viability, as demonstrated by live/dead staining (live = green, red = dead) on magnetically 3D bioprinted spheroids of 10,000 HepG2 hepatocellular carcinoma cells in a 384-well plate. Scale bar = 500 µm
